

## Battery Condition Analysis Report

This report summarises battery temperature patterns, thermal deltas, and cell-voltage deltas over the selected analysis window. Values are calculated by grouping observations into defined bucket ranges and computing the percentage distribution of occurrences during **CHARGING** and **DISCHARGING** modes.

- **Battery Max Temperature Distribution** buckets reflect absolute maximum temperature observed per timestamp.
- **Temperature Delta Distribution** uses (max – min) pack temperature per timestamp.
- **Voltage Delta Distribution** uses (max – min) cell voltage per timestamp.

Fleet-level summaries aggregate all vehicles and show the proportional time spent in each bucket. Vehicle-level pages present the same distributions for each vehicle separately.
